

Health and environment are our priority. We are not focused on one disease, we are not focused on one age. We have to do it all, because the environment affects everyone.

Now in order to do this, not only do we need the best individual science - and you ONES awardees are really keen examples of some people doing some of the best, more individual kind of science - we are also very interested in the best team science. It's complex environmental exposures, associated with effects. And it's never just the environment, or just genes, it's always an interaction between the two, and it often takes teams to address these issues.

So we provide lots of training opportunities. In the middle of this slide, you can see the one that you are the recipients of, which is the ONES award, and again this is an exciting opportunity for you. I can't congratulate all of you enough. This is a great one to get — five-year, good funding, instrumentation, kind of makes your life.... takes a little of that pressure off in the first few years.
